

# DAMP & TIMBER TRAINING COURSE

LISTEN TO THE EXPERTS

Damp Proof Training Course provides an overview of how to identify the most common forms of dampness, condensation, rain penetration and rising damp; why this happens, the conditions needed and how to successfully solve the issues in hand.

Timber rot and woodworm are timber issues that can cause serious structural damage if not identified and treated early. During our training sessions we will cover all stages of the following timber issues: dry rot, wet rot, woodworm treatment.

While woodworm can affect any untreated timber elements, dry and wet rot problems can only occur if the timber moisture content reaches levels above 20%. Our training specialist will share their knowledge and cover various problem scenarios as well as ways to measure the scale of the problem. Knowing the factors that lead to effective specification will improve your ability to provide advice to your clients and understand the appropriate repair.
